Beginners Advanced Free Diving

Mashabi Island, at the westernmost point of the project, forms part of a group of islands, some connected via sand bridges. Beneath this idyllic paradise is a classic Red Sea reef wall diving experience, characterised by soft and hard coral formations, table corals, a sandy platform at 40m and an intriguing variety of marine species.

The reef is dominated by fire and stony corals, vividly coloured red finger sponges and features all sorts of resident fish. Bannerfish are a common sight, their elegant profile and acid-yellow and black stripes making them a favourite subject for photographers. The giant moray eel also makes an appearance. There's also plenty of shark activity at North Bream, which is an indicator of a healthy reef. The resident whitetip and blacktip reef sharks tend to swim in a loop, so if you see one, there's no need to follow it.

Along with sharks, lucky divers may catch a glimpse of the rare whitespotted guitarfish, which are usually spotted in deeper waters along with giant groupers. These colossal, curious fish, weighing 60-70kg are seen at around 40 to 50m. Pelagics, too, can be sighted at North Bream, including great barracudas, the solitary creatures spanning an enormo
